

KioskControl UG — Innovation Village Incubation Application

Applicant: Collin

Date: June 2026

Programme: Innovation Village Incubation Programme, Kampala

1. What problem are you solving?

Uganda's 300,000+ mobile money agents collectively lose billions of shillings every year to three invisible problems that existing tools do not address.

First: unrecorded informal cash loans. When an agent at a Nansana kiosk has a customer who wants to withdraw UGX 500,000 but the agent has no cash, they run next door and borrow from another agent. This happens dozens of times a day across every trading cluster in Kampala, Mbarara, Gulu, and Jinja. The transaction is recorded in human memory — and human memory fails. By close of business, neither agent can confirm who owes what. Losses from these forgotten loans are a routine monthly reality for every agent we have spoken with.

Second: commission theft by hired workers. Most kiosk owners employ staff to run the counter while they manage logistics or other businesses. MTN and Airtel pay commissions directly into the agent's SIM wallet in real time with every transaction. A dishonest worker can use USSD menus to withdraw these commissions to their own number throughout the day. The owner arrives at closing, counts the cash, and assumes it balances — unaware that UGX 40,000–80,000 in commissions has already been extracted. There is currently no affordable tool that flags this discrepancy automatically.

Third: fake SMS fraud. Sophisticated fraudsters construct messages that look exactly like official MTN or Airtel transaction confirmations — including the agent's real account balance, obtained through phone spyware or insider data leaks. An agent sees the familiar-looking text, believes a UGX 1,000,000 withdrawal has been processed, and hands over cash to a customer who paid nothing. The Fraud is discovered only when the agent checks their actual statement hours later.

These are not edge cases. They are daily operational realities, observed firsthand on active agent distribution routes across Greater Kampala and Wakiso District.

2. What is your solution?

KioskControl UG is an automated business control system for mobile money agents that requires zero manual data entry.

The core engine works as follows: every time an agent completes a transaction, MTN or Airtel sends a notification to the agent's phone. KioskControl reads this notification in the background — without requiring the agent to open the app or type anything — and automatically builds a live business ledger. At 8:00 PM, the owner opens one screen and sees whether their cash, float, and commissions match what the system expects. If they do not match, the app tells them specifically where the discrepancy likely occurred.

Beyond the core automation, the app includes four additional features that solve the informal-economy problems current tools ignore:

- **The Money Outside Ledger** — a two-tap tool for logging cash lent to neighbouring agents or given on credit to trusted customers, with an automatic 6:00 PM reminder of outstanding amounts.
 - **The Instant Tariff Calculator** — agents can look up the exact fee and 0.5% government tax for any transaction size instantly, without memorising tiered rate cards.
 - **The Fraud Alert Engine** — when an incoming notification's metadata does not match the expected structural pattern of an official telecom message, the app blocks the worker from proceeding and shows a full-screen fraud warning.
 - **The Multi-Kiosk Dashboard** — for master agents owning multiple kiosks, a single screen shows the status of every location without requiring physical visits.
-

3. Who is your target customer and how large is the market?

Primary customer: Mobile money agent kiosk owners in Uganda — specifically those operating multiple kiosks or employing hired workers.

Uganda had approximately 334,000 registered mobile money agent outlets as of 2024 (Bank of Uganda), with Kampala and the Central Region hosting the highest concentration. The immediate addressable market within Greater Kampala and Wakiso District alone is estimated at 40,000–60,000 active agent locations.

At a subscription price of UGX 30,000 per month per kiosk (approximately USD 8), the addressable annual revenue within Uganda is approximately USD 14 million at full penetration. Master agents managing 3–10 kiosks are the priority segment, representing an estimated 12% of operators but controlling a disproportionate share of daily transaction volume.

Regional expansion market: East Africa's mobile money agent network exceeds 1.5 million registered points across Uganda, Kenya, Tanzania, and Rwanda. The same operational problems exist in every market — the architecture requires only a network-specific notification parser to deploy in each new country.

4. What is your business model?

KioskControl operates on a tiered monthly subscription:

Tier	Target user	Price (UGX/ month)	Key features
Free	Single kiosk, trial	0	SMS auto-ledger, tariff calculator
Pro	Active single kiosk	30,000	Full fraud detection, Money Outside, daily reports
Master	Multi-kiosk owner	80,000	All Pro features + multi-kiosk dashboard, worker monitoring
Association	Agent umbrella bodies	Negotiated annually	Bulk deployment, branded portal

A second revenue stream is planned for Phase 2: transaction-data-backed microfinance referrals. Agents who maintain 90 days of verified transaction history through KioskControl will be referred to partner microfinance institutions for working capital loans. KioskControl will earn a 1.5-2% referral fee per disbursement.

5. Who is the team?

Collin — Founder & CEO

Collin has worked in mobile money distribution across Greater Kampala and Wakiso District, visiting dozens of agent kiosks weekly as part of float supply and agent servicing operations. This frontline experience is the direct source of every product insight in this application — none of the problems identified were discovered through research; they were observed in operation.

Collin maintains a direct working relationship with the Vice President of the national mobile money agents umbrella association, providing immediate access to the industry's largest organised network of operators for product validation and pilot deployment.

[Technical Co-founder — CTO position open]

KioskControl is actively recruiting a technical co-founder with Android development experience to own the engineering architecture. Candidates are currently being evaluated. The founding team will be complete prior to incubation commencement.

6. What stage are you at?

KioskControl is at the **pre-product, post-validation** stage.

- The full product blueprint and technical architecture have been developed in detail.
- The core problem has been validated through direct field observation over multiple years.
- A pilot cohort of 10 agent kiosk owners has been identified through the association VP relationship, ready to test the MVP upon completion.
- Company registration is in progress.
- A technical co-founder search is active.

The immediate goal upon joining the Innovation Village programme is to complete the MVP build and launch the 10-agent closed pilot within 90 days.

7. What do you need from Innovation Village?

Technical mentorship — guidance on Android development best practices, specifically around notification listeners, local database architecture, and Google Play Store financial app category approval.

Legal and compliance support — assistance navigating Uganda's Data Protection and Privacy Act 2019 and PDPO registration requirements, which are essential before the app touches any agent's financial data.

Investor network access — introductions to East African seed investors and regional funds appropriate for a pre-revenue fintech utility at the validation stage.

Co-founder matching — access to Innovation Village's developer community to accelerate the technical co-founder search.

Workspace — a professional environment for team meetings, product sprints, and pilot agent interviews.

8. What impact will this create?

Mobile money agents are the financial infrastructure of informal Uganda. They serve customers who have no bank accounts in markets where formal banking branches do not exist. When agents lose money to fraud, theft, or unrecorded loans, they reduce their float, serve fewer customers, and in some cases close permanently.

KioskControl directly protects the capital of Uganda's micro-enterprise financial service providers. For every UGX 50,000 in monthly losses we prevent per agent, that capital stays in the local economy — in restocked float, in school fees, in household income.

At 10,000 active agents — a target we believe is achievable within three years in Uganda alone — KioskControl would protect an estimated UGX 6 billion in agent capital per month from leakage. That is not a fintech metric. That is a structural economic contribution.

9. Why will you win?

Three things that are not replicable by a competitor arriving today:

Insider knowledge. The problems in this application were not found in a report. They were observed on live distribution routes. A competitor reading this document cannot absorb the two years of contextual understanding behind it.

Distribution pre-wired. The Vice President of the national agents association is an active daily contact. When the product is ready, the pilot is not a sales challenge — it is a scheduling conversation.

Timing. Uganda's mobile money sector processed over UGX 80 trillion in transactions in 2023 (Bank of Uganda). The agents handling this volume have no professional-grade operating tools. That gap will not exist indefinitely. The window to define the category standard belongs to whoever ships first with association trust.
